Report Summary

Introduction

This report contains the most current and comprehensive statistics available—for 2008—on rates of teenage pregnancy, birth and abortion, and numbers of teenage pregnancies, births, abortions and miscarriages, all by state. It also includes population counts and trends in each state's teenage pregnancy and abortion rates for 1988–2008 and trends in birth rates for 1988–2010. The report concludes with a discussion of the methodology and sources used to obtain the estimates.

This report is an update of previously published state-level statistics, which included state-level statistics through 2005 and national-level statistics to 2006. Updated <u>national-level teen pregnancy statistics</u> through 2008 were published in early 2012.

A demographic rate is defined as the number of events (in this case, pregnancies, births or abortions) divided by the number of individuals who could experience the event—the "population." The Census Bureau and the National Center for Health Statistics (NCHS) revised estimates of the size of the teen population between 2000 and 2009, following the 2010 decennial census.³ This report therefore includes revised estimates of rates for each state for 2000 and 2005 and supersedes our previous estimates (see Appendix).

The pregnancy rate is composed of the rates of pregnancy outcomes: births, abortions and miscarriages; it is not synonymous with the birthrate. Trends in rates of births, abortions and pregnancies can move in different directions and may be affected by different social and economic factors.

Data on U.S. births become available much earlier than data for abortions and, hence, statistics on pregnancy. At the time of this report, final numbers of births from national vital statistics are available through 2010. Complete data on abortion, based on the Guttmacher Institute's Abortion Provider Census, are currently available only through 2008. Therefore, this report includes pregnancy and abortion rates for 2008 and birthrates for 2008 and 2010.

Unless otherwise indicated, in this report, the words "teenagers" and "teens" refer to women aged 15–19. The report also includes numbers, and in some cases rates, shown separately for teens younger than 15, 15–17-year-olds and 18–19-year-olds.

Key findings

State levels in 2008 (Tables 1.1–1.3, 1.6)*

• In 2008, New Mexico had the highest teenage pregnancy rate (93 pregnancies per 1,000 women aged 15–19); the next highest rates were in Mississippi, Texas, Nevada, Arkansas and Arizona. The lowest rates were in New Hampshire (33 per 1,000), Vermont, Minnesota, North Dakota and Massachusetts.

^{*}These observations exclude the District of Columbia, which is more comparable to a city than a state.

- In 2008 and 2010, teenage birthrates were highest in Mississippi (55 per 1,000 in 2010), New Mexico, Arkansas and Texas. The states with the lowest teenage birthrates were New Hampshire (16 per 1,000 in 2010), Massachusetts, Vermont, Connecticut and New Jersey.
- Teenage abortion rates in 2008 were highest in New York (37 abortions per 1,000 women aged 15–19), Delaware, New Jersey, Hawaii and Connecticut. By contrast, teenage abortion rates of seven or less were found in South Dakota (5 per 1,000), Utah, Nebraska and Kentucky.
- More than half of teenage pregnancies (excluding miscarriages) ended in abortion in New Jersey, New York and Connecticut.
- Fourteen percent or fewer teenage pregnancies ended in abortion in six states: Kentucky, South Dakota, Arkansas, Oklahoma, Utah and West Virginia.
- In general, states with the largest numbers of teenagers also had the greatest numbers of teenage pregnancies in 2008. California recorded the highest number of pregnancies among women aged 15–19 (98,530), followed by Texas, New York, Florida and Illinois (with 31,000–76,000 each). The smallest numbers of teenage pregnancies were in Vermont, North Dakota, Wyoming, South Dakota and New Hampshire, all of which reported fewer than 1,600 pregnancies among teens.
- While 18–19-year-olds comprised roughly 40% of all 15–19-year-old women in most states in 2008, their pregnancies accounted for 64–76% of all teen pregnancies.

Trends (Table 1.3)

- Between 1988 and 2000, and again between 2000 and 2005, teenage pregnancy rates declined in every state. However, between 2005 and 2008, the rate decreased 5% or more in 7 states, while increasing by 5% or more in 16 states. These changes may indicate year-to-year fluctuations, rather than trends (see Discussion, below).
- New Jersey experienced the largest decrease in the teen pregnancy rate between 2005 and 2008, dropping from 71 to 62 pregnancies per 1,000 women aged 15–19, a 13% decline. Rates in Nevada and Arizona dropped 9% and 8%, respectively, between 2005 and 2008. During the same period, Louisiana experienced the largest increase in the teen pregnancy rate of any state, its rate rising 19%, from 67 to 80 per 1,000. However, Louisiana's rate in 2005 was unusually low, probably because of disruptions caused by Hurricane Katrina. Utah and Pennsylvania also experienced rate increases of more than 10% (12% and 11%, respectively).
- In 2005–2008, birthrates among teenagers aged 15–19 decreased most in Arizona (7%) and Florida (5%). Twenty-one states' teen birthrates increased 5% or more, with increases of at least 12% in Vermont, Louisiana, Utah, Montana and Wyoming.
- Between 2005 and 2008, abortion rates among teens decreased 5% or more in 25 states, and five states experienced declines of 15% or more: New Jersey, Nevada, Vermont, Wisconsin and Wyoming. Abortion rates among teens increased 5% or more in only eight states, and the

increase was at least 15% in four of these states: Louisiana, Delaware, † Pennsylvania and Arkansas

State levels by race and ethnicity (Tables 1.4–1.6)

- Many states do not have, or could not provide, data on the race or ethnicity of teenagers obtaining abortions. Therefore, estimates of pregnancy rates among non-Hispanic white teenagers are available for 20 states, rates among black teenagers are available for 27 states and rates among Hispanic teenagers are available for 21 states.
- Pregnancy rates among non-Hispanic white teenagers ranged from 58 to 70 per 1,000 women aged 15–19 in many southern states for which data were available, including Arkansas, Kentucky, Mississippi, West Virginia, Texas and South Carolina. Lower rates, ranging from 29 to 39 per 1,000, were found in Minnesota, Wisconsin, New York and Vermont. However, many states do not record abortions by age, race and ethnicity. In addition, a few states that do record these demographic details were unable to provide data for use in this report.
- High pregnancy rates among black teenagers aged 15–19 were evident in Texas, New York, Ohio, Michigan, Delaware and Wisconsin (122–161 per 1,000). South Dakota, Utah, Alaska and West Virginia all had lower rates, at 53–76 per 1,000 among black teenagers.
- Pregnancy rates among Hispanic teens were relatively high in Alabama, Delaware, Georgia and South Carolina, ranging from 139 to 160 pregnancies per 1,000 Hispanic women aged 15–19. In contrast, pregnancy rates among Hispanic teenagers were low in Vermont and West Virginia (26 per 1,000 and 46 per 1,000, respectively).

Discussion

Teen pregnancy rates in all 50 states have steadily declined over the past 20 years. While the increase in the rate in some states from 2005 to 2008 is troubling, these increases appear to be short-term. Recent evidence—including further reductions in birthrates in nearly all states between 2008 and 2010, and decreases in the numbers of abortions for 2009 reported by the states to the Centers for Disease Control and Prevention⁵—indicates that pregnancy rates have also continued to decline. Yet even with long-term and ongoing declines, substantial disparities between states remain.

Once complete 2010 data on abortions become available, we expect to be able to confirm these preliminary indications of state-level declines in the pregnancy rate and measure the magnitude of declines in the more recent period. Teen abortion rates have also been stable or declining in most states, with only eight states showing an increase between 2005 and 2008. If abortion rates stay relatively unchanged through 2010, teen pregnancy rates in individual states, like birthrates, will decline.

All demographic rates depend on accurate counts of the population. The most accurate counts for the U.S. population are obtained decennially (in census years), and these counts are used to

[†]The rate increase in Delaware was mostly due to underreporting of abortions by one provider in 2005.⁴

create improved estimates of the population in the years between censuses (the intercensal populations). When these population estimates are revised, rates can also be revised. These revised rates may cause some initial confusion; in some cases, the direction of trends observed in earlier publications could even change. However, it is essential to produce these revised estimates once intercensal population counts are available in order to provide the most accurate estimate of the rates for earlier years. When the most recent intercensal population counts were released, there were substantial changes in the Census Bureau's estimates of the female teen population for some states, particularly for 2005. Our prior publication containing the 2005 rates used the population counts available at that time; the appendix to this document contains the revised state tables for 2005 based on the final intercensal population counts. The estimates in this report for years through 2008 can now be considered final, because once population counts are updated using new census numbers, they are not updated again.

Acknowledgments

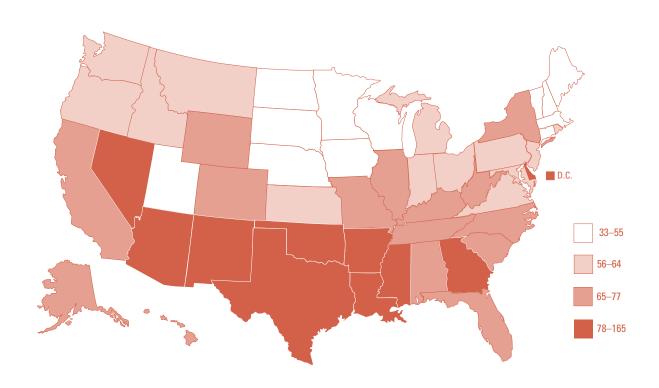

This report was prepared by Kathryn Kost and Stanley Henshaw of the Guttmacher Institute. Laura Lindberg, Lawrence Finer, Rebecca Wind and Marjorie Crowell provided comments on drafts. The report was made possible by a grant from The California Wellness Foundation (TCWF). The Guttmacher Institute gratefully acknowledges the general support it receives from individuals and foundations, including major grants from The William and Flora Hewlett Foundation, the David and Lucile Packard Foundation and the Ford Foundation, which undergirds all of the Institute's work.

^{*}All rates are the number of events per 1,000 women aged 15–19, 15–17 or 18–19, as indicated by column heading; pregnancy rate includes estimated number of pregnancies ending in miscarriage or stillbirth.†Abortions per 100 pregnancies ending in abortion or live birth. ‡Abortion estimates are based on the number of abortions among all women in the state and the proportion of abortions obtained by women of the same age nationally. §Abortions among women aged 15–19 were apportioned between those aged 15–17 and those aged 18–19, according to the proportions in neighboring states. **Abortion estimates are based on the number of abortions among all women in the state and the proportion of abortions obtained by women of the same age in neighboring states.

Notes: Even though abortions have been tabulated according to state of residence where possible, in states with parental notification or consent requirements for minors, the pregnancy and abortion rates may be underestimated because minors have traveled to other states for abortion services, and the rates in neighboring states may be overestimated. na=not applicable.

^{*}Rounded to the nearest 10. †Includes estimated number of pregnancies ending in miscarriage or stillbirth. ‡Estimated as 20% of births plus 10% of abortions; includes stillbirths. §Fewer than five abortions or miscarriages/stillbirths. **Estimates based on the number of abortions obtained by all women in the state and the proportion of abortions obtained by women of the same age nationally. ††Abortions among women aged 15–19 were apportioned between those aged 15–17 and those aged 18–19, according to the proportions in neighboring states. ‡‡Abortion estimates are based on the number of abortions among all women in the state and the proportion of abortions obtained by women of the same age in neighboring states.

Note: Even though abortions have been tabulated according to state of residence where possible, in states with parental notification or consent requirements for minors, the number of pregnancies may be underestimated because minors have traveled to other states for abortion services, and numbers in neighboring states may be overestimated.

[&]quot;All rates are the number of events per 1,000 women aged 15–19; pregnancy rate includes estimated number of pregnancies ending in miscarriage or stillbirth. †Estimate based on the number of abortions among all women in the state and the proportion of abortions obtained by women of the same age in neighboring or similar states. ‡Estimate based on the number of abortions among all women in the state and the proportion of abortions obtained by women of the same age nationally. §Estimate obtained by applying the average of the proportions of abortions among 15–19-year-old women in Wyoming in 1992, 1996 and 1999 to the number of abortions among all women in the state in 2000. The number of Wyoming residents having abortions in Colorado may have been overestimated in 2000.

Note: Even though abortions have been tabulated according to state of residence where possible, in states with parental notification or consent requirements for minors, the pregnancy and abortion rates may be too low because minors have traveled to other states for abortion services, and the rates in neighboring states may be too high. Estimates for 2000 and 2005 differ from those previously published, as the ones in this report are based on population numbers updated using the 2010 Census (intercensal estimates). Birthrates in 2010 are based on final birth numbers from NCHS. Because abortion data for 2010 is not yet available, neither pregnancy nor abortion rates for 2010 can be estimated.

^{*}All rates are the number of events per 1,000 women aged 15–19; pregnancy rate includes estimated number of pregnancies ending in miscarriage or stillbirth. †Includes white births with ethnicity unknown. ‡Rate not calculated because population base of women aged 15–19 was less than 500.

Notes: Estimates for all states are included in Total. In states with parental notification or consent requirements for minors, pregnancy and abortion rates may be underestimated because minors have traveled to other states for abortion services, and rates in neighboring states may be overestimated. Pregnancy rates and abortion rates in parentheses include abortions obtained by Hispanic women; in these states,≤10% of births among white women 15–19 were to Hispanics. u=unavailable.

About the Tables

State-Level Methodology

The figures in these tables are based on data from the following sources (exact sources are listed in subsequent paragraphs):

- Number of births—National Center for Health Statistics (NCHS) of the U.S. Department of Health and Human Services
- Total number of abortions to residents of each state—Guttmacher Institute and the U.S. Centers for Disease Control and Prevention (CDC)
- Tabulations of abortion data by age and race or ethnicity—state departments of health
- Population estimates—Population Estimates Program of the U.S. Bureau of the Census in collaboration with NCHS

Pregnancies are the sum of births, abortions and miscarriages. In these tables, "age" refers to the woman's age when the pregnancy ended. Consequently, the actual numbers of pregnancies that occurred among teenagers are higher than those reported here, because most of the women who conceived at age 19 had their births or abortions after they turned 20 and thus were not counted as teenagers. Likewise, "year" refers to the calendar year in which the birth or abortion occurred, not the year in which conception occurred.

The figures may differ from those found in other sources. First, these data are not adjusted to reflect the woman's age at conception or the year in which she conceived. Second, unlike other reports that exclude miscarriages, this one includes estimated numbers and rates of pregnancies ending in miscarriage. (Pregnancy rates excluding miscarriages can be calculated from the tables by summing the rates of births and abortions.) The number of miscarriages was estimated as 20% of births plus 10% of abortions; these proportions attempt to account for miscarriages that occurred after the pregnancy had lasted long enough to be noticed by the woman (6–7 weeks after her last menstrual period). Stillbirths are a very small proportion of all pregnancies and are included in our estimates of miscarriages. Also, denominators are based on population estimates that are produced by the Bureau of the Census, in collaboration with NCHS, for July 1 of each year and are revised periodically. The population numbers used for 2000, 2005 and 2008 in this report are the most recent revision of the intercensal estimates for 2000–2009, released on October 26, 2012. Revised state-level tables for teen pregnancy statistics through 2005 are included in an appendix.

The Guttmacher Abortion Provider Censuses of all known abortion providers in each state provide the annual numbers of abortions in each state for 1988, 1992, 1996, 2000, 2005 and 2008. Starting with the number of abortions performed in each state for women of all ages (residents and nonresidents),⁴ we reassigned abortions to the woman's state of residence on the basis of information collected by state abortion reporting agencies. In 2008, this information was compiled by the CDC and made available in a table showing, for each state, the state of residence for each woman who had an abortion in that state.⁵ Some states, however, do not collect this information; for these states, we asked a sample of abortion facilities where the women obtaining abortions said they lived.* The CDC table suppressed any cell with fewer than 50 abortions, so we used the more complete data available from many state health department

Web sites and, where necessary, contacted the states directly for this information. To estimate the number of nonresidents who had abortions in each state, we applied the percentage distribution of women having abortions, by state of residence, to our count of the total number of abortions that took place in each state.

Of the state residents having abortions, the proportions who were younger than 15, 15–17 and 18–19 were taken from the CDC Abortion Surveillance Report. For states with incomplete or no information on the age of women having abortions in 2008, we estimated the proportion of abortions obtained by teenagers by using the national distribution or the distribution from neighboring states (see notes to tables for state-specific calculation methods). Since there is a high correlation between a state's overall abortion rate and the abortion rate among teenagers, our method gives a fair approximation of the number and rate of abortions among teenagers.

Since the CDC does not release data showing the race or ethnic distributions of teenagers having abortions by state, we contacted the state health departments for this information or, in a few states, were able to obtain it from the states' department of health Web site. The race and ethnic distributions were then applied to our estimate of the number of abortions obtained by state residents aged 15–19. We made no estimates for states that did not provide the race or ethnicity data.

Our calculation methods assume that teenagers travel outside their home state for abortion services in the same proportions as do older women.[‡] This assumption may not be valid in states where minors travel out of state to avoid parental involvement requirements or in the states to which they travel.

Interpreting the Data

Because health department abortion statistics are incomplete or nonexistent in some states, care should be used in interpreting the teenage abortion and pregnancy data. For the states with no information on the age of women having abortions, the rate of abortion among teenagers was estimated. Similarly, error is introduced by the assumption that teenagers have abortions out of state in the same proportions as older women. Therefore, one cannot draw inferences about the effects of parental involvement requirements on the number of abortions obtained by minors.

Footnotes

*Arizona, Florida, Iowa, Kentucky, Louisiana, Maryland, Massachusetts, New Hampshire, Rhode Island and West Virginia. In addition, we assumed that for California, the percentage (0.5%) and distribution of out-of-state abortions in 2008 were the same as in 1982, the last year for which this information is available, and combined this with information obtained directly from a small number of providers in 2007 on the number of abortions provided to residents of Mexico.

†California, Florida, Louisiana, Maryland, New Hampshire and Wyoming.

‡In 1996 only, we used age-specific data on state of residence for some states.

^{*}All rates are the number of events per 1,000 women aged 15–19, 15–17 or 18–19, as indicated by column heading; pregnancy rate includes estimated number of pregnancies ending in miscarriage or stillbirth.†Abortions per 100 pregnancies ending in abortion or live birth. ‡Abortion estimates are based on the number of abortions among all women in the state and the proportion of abortions obtained by women of the same age nationally. §Abortions among women aged 15–19 were apportioned between those aged 15–17 and those aged 18–19, according to the proportions in neighboring states. **Abortion estimates are based on the number of abortions among all women in the state and the proportion of abortions obtained by women of the same age in neighboring states.

Notes: Even though abortions have been tabulated according to state of residence where possible, in states with parental notification or consent requirements for minors, the pregnancy and abortion rates may be underestimated because minors have traveled to other states for abortion services, and the rates in neighboring states may be overestimated. na=not applicable.

^{*}Rounded to the nearest 10. †Includes estimated number of pregnancies ending in miscarriage or stillbirth. ‡Estimated as 20% of births plus 10% of abortions; includes stillbirths. \$Fewer than five abortions or miscarriages/stillbirths. *Estimates based on the number of abortions to all women in the state and the proportion of abortions obtained by women of the same age nationally. ††Abortions among women aged 15–19 were apportioned between those aged 15–17 and those aged 18–19, according to the proportions in neighboring states. ‡‡Abortion estimates are based on the number of abortions among all women in the state and the proportion of abortions obtained by women of the same age in neighboring states.

Note: Even though abortions have been tabulated according to state of residence where possible, in states with parental notification or consent requirements for minors, the number of pregnancies may be underestimated because minors have traveled to other states for abortion services, and numbers in neighboring states may be overestimated.

*All rates are the number of events per 1,000 women aged 15–19; pregnancy rate includes estimated number of pregnancies ending in miscarriage or stillbirth.†Estimate based on the number of abortions among all women in the state and the proportion of abortions obtained by women of the same age in neighboring or similar states. ‡Estimate based on the number of abortions among all women in the state and the proportion of abortions obtained by women of the same age nationally. §Estimate obtained by applying the average of the proportions of abortions among 15–19-year-old women in Wyoming in 1992, 1996 and 1999 to the number of abortions among all women in the state in 2000. The number of Wyoming residents having abortions in Colorado may have been overestimated in 2000.

Note: Even though abortions have been tabulated according to state of residence where possible, in states with parental notification or consent requirements for minors, the pregnancy and abortion rates may be underestimated because minors have traveled to other states for abortion services, and the rates in neighboring states may be overestimated. Estimates for 2000 and 2005 differ from those previously published, as the ones in this report are based on populaton numbers updated using the 2010 Census (intercensal estimates).

Table R-3.4 State-specific rates of pregnancy, birth and abortion among women aged 15-19, by race and ethnicity, 2005

^{*}All rates are the number of events per 1,000 women aged 15–19; pregnancy rate includes estimated number of pregnancies ending in miscarriage or stillbirth. †Includes white births with ethnicity unknown. ‡Rate not calculated because population base of women aged 15–19 was less than 500.

Notes: Estimates for all states are included in Total. In states with parental notification or consent requirements for minors, pregnancy and abortion rates may be underestimated because minors have traveled to other states for abortion services, and rates in neighboring states may be overestimated. Pregnancy rates and abortion rates in parentheses include abortions obtained by Hispanic women; in these states, ≤10% of births among white women 15–19 were to Hispanics. u=unavailable.

^{*}Rounded to the nearest 10. †Includes estimated number of pregnancies ending in miscarriage or stillbirth. ‡Estimated as 20% of births plus 10% of abortions; includes stillbirths. §Includes white births with ethnicity unknown. **Fewer than five abortions or miscarriages/stillbirths.

Notes: Numbers of pregnancies and abortions in parentheses include abortions obtained by Hispanic women; in these state≰10% of births among white women aged 15–19 were to Hispanics. Numbers of miscarriages and stillbirths in parentheses include those estimated from abortions obtained by Hispanic women; in these states ≤10% of births among white women 15–19 were to Hispanics. Even though abortions have been tabulated according to state of residence where possible, in states with parental notification or consent requirements for minors, the number of abortions and pregnancies may be underestimated because minors have traveled to other states for abortion services, and the number in neighboring states may be overestimated. u=unavailable.
